**TITLE OF THE INVENTION****3,4-DIARYL-2-HYDROXY-2,5-DIHYDROFURANS AS PRODRUGS  
TO COX-2 INHIBITORS****5 BACKGROUND OF THE INVENTION**

This invention relates to methods of treating cyclooxygenase mediated diseases and certain pharmaceutical compositions therefor.

Non-steroidal, antiinflammatory drugs exert most of their  
10 antiinflammatory, analgesic and antipyretic activity and inhibit hormone-induced uterine contractions and certain types of cancer growth through inhibition of prostaglandin G/H synthase, also known as cyclooxygenase. Initially, only one form of cyclooxygenase was known, this  
corresponding to cyclooxygenase-1 (COX-1) or the constitutive enzyme,  
15 as originally identified in bovine seminal vesicles. More recently the gene for a second inducible form of cyclooxygenase, cyclooxygenase-2 (COX-2) has been cloned, sequenced and characterized initially from chicken, murine and human sources. This enzyme is distinct from the  
COX-1 which has been cloned, sequenced and characterized from various  
20 sources including the sheep, the mouse and man. The second form of cyclooxygenase, COX-2, is rapidly and readily inducible by a number of agents including mitogens, endotoxin, hormones, cytokines and growth factors. As prostaglandins have both physiological and pathological  
roles, we have concluded that the constitutive enzyme, COX-1, is  
25 responsible, in large part, for endogenous basal release of prostaglandins and hence is important in their physiological functions such as the maintenance of gastrointestinal integrity and renal blood flow. In contrast, we have concluded that the inducible form, COX-2, is mainly  
responsible for the pathological effects of prostaglandins where rapid  
30 induction of the enzyme would occur in response to such agents as inflammatory agents, hormones, growth factors, and cytokines. Thus, a selective inhibitor of COX-2 will have similar antiinflammatory, antipyretic and analgesic properties to a conventional non-steroidal antiinflammatory drug, and in addition would inhibit hormone-induced

uterine contractions and have potential anti-cancer effects, but will have a diminished ability to induce some of the mechanism-based side effects. In particular, such a compound should have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a  
5 reduced effect on bleeding times and possibly a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects.

Furthermore, such a compound will also inhibit prostanoid-induced smooth muscle contraction by preventing the synthesis of contractile prostanoids and hence may be of use in the treatment of  
10 dysmenorrhea, premature labour, asthma and eosinophil related disorders. It will also be of use in the treatment of Alzheimer's disease, for decreasing bone loss particularly in postmenopausal women (i.e. treatment of osteoporosis) and for the treatment of glaucoma.

A brief description of the potential utility of  
15 cyclooxygenase-2 inhibitors is given in an article by John Vane, Nature, Vol. 367, pp. 215-216, 1994, and in an article in Drug News and Perspectives, Vol. 7, pp. 501-512, 1994.

### SUMMARY OF THE INVENTION

20 The invention encompasses the novel compound of Formula I as well as a method of treating cyclooxygenase-2 mediated diseases comprising administration to a patient in need of such treatment of a non-toxic therapeutically effective amount of a compound of Formula I. These compounds are prodrugs of compounds which inhibit COX-2  
25 selectively over COX-1. The prodrugs are converted *in vivo* to the selective inhibitors.

- 3 -

The invention also encompasses certain pharmaceutical compositions for treatment of cyclooxygenase-2 mediated diseases comprising compounds of Formula I.

fever, symptoms associated with influenza or other viral infections, common cold, low back and neck pain, dysmenorrhea, headache, toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis, degenerative joint diseases (osteoarthritis),  
5   gout and ankylosing spondylitis, bursitis, burns, injuries, following surgical and dental procedures. In addition, such a compound may inhibit cellular neoplastic transformations and metastatic tumor growth and hence can be used in the treatment of cancer. Compound I may also be of use in the treatment and/or prevention of cyclooxygenase-mediated proliferative  
10   disorders such as may occur in diabetic retinopathy and tumour angiogenesis.

Compound I will also inhibit prostanoid-induced smooth muscle contraction by preventing the synthesis of contractile prostanoids and hence may be of use in the treatment of dysmenorrhea, premature  
15   labor, asthma and eosinophil related disorders. It will also be of use in the treatment of Alzheimer's disease, and for the prevention of bone loss (treatment of osteoporosis) and for the treatment of glaucoma.

By virtue of its high cyclooxygenase-2 (COX-2) activity and/or its specificity for cyclooxygenase-2 over cyclooxygenase-1 (COX-  
20   1), Compound I will prove useful as an alternative to conventional non-steroidal antiinflammatory drugs (NSAID'S) particularly where such non-steroidal antiinflammatory drugs may be contra-indicated such as in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent history of gastrointestinal lesions; GI

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents,

- 38 -

coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets.

- 5 These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by  
10 known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the  
15 technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

- Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or  
20 as soft gelatin capsules wherein the active ingredients is mixed with water or miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

- Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous  
25 suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with  
30 fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products

- 39 -

of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one  
5 or more flavoring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example, arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The  
10 oily suspensions may contain a thickening agent, for example, beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

15 Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned  
20 above. Additional excipients, for example, sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for  
25 example, liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example, soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example, polyoxy-  
30 ethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example, glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring

- 40 -

- and coloring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have
- 5 been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution.
- 10 Cosolvents such as ethanol, propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.
- 15 Compound I may also be administered in the form of a suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug.
- 20 Such materials are cocoa butter and polyethylene glycols.
- For topical use, creams, ointments, gels, solutions or suspensions, etc., containing the compound of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised
- 25 of a pharmaceutical carrier, cosolvent, emulsifier, penetration enhancer, preservative system, and emollient.
- Dosage levels of the order of from about 0.01 mg to about 140 mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5 mg to about 7 g per
- 30 patient per day. For example, inflammation may be effectively treated by the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

- 41 -

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 mg to 5 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

Assays for determining Biological Activity

The compound of Formula I can be tested using the following assays to determine their cyclooxygenase-2 inhibiting activity.

5

INHIBITION OF CYCLOOXYGENASE ACTIVITY

Compounds are tested as inhibitors of cyclooxygenase activity in whole cell cyclooxygenase assays. Both of these assays measure prostaglandin E<sub>2</sub> synthesis in response to arachidonic acid, using a radioimmunoassay. In these assays, 100% activity is defined as the difference between prostaglandin E<sub>2</sub> synthesis in the absence and presence of arachidonate.

15 Whole Cell Assays

For cyclooxygenase assays, osteosarcoma cells are cultured in 1 mL of media in 24-well multidishes (Nunc) until confluent ( $1-2 \times 10^5$  cells/well). U-937 cells are grown in spinner flasks and resuspended to a final density of  $1.5 \times 10^6$  cells/mL in 24-well multidishes (Nunc). Following washing and resuspension of osteosarcoma and U-937 cells in 1 mL of HBSS, 1  $\mu$ L of a DMSO solution of test compound or DMSO vehicle is added, and samples gently mixed. All assays are performed in triplicate. Samples are then incubated for 5 or 15 minutes at 37°C, prior to the addition of arachidonic acid. Arachidonic acid (peroxide-free, Cayman Chemical) is prepared as a 10 mM stock solution in ethanol and further diluted 10-fold in HBSS. An aliquot of 10  $\mu$ L of this diluted solution is added to the cells to give a final arachidonic acid concentration of 10  $\mu$ M. Control samples are incubated with ethanol vehicle instead of arachidonic acid. Samples are again gently mixed and incubated for a further 10 min. at 37°C. For osteosarcoma cells, reactions are then stopped by the addition of 100  $\mu$ L of 1N HCl, with mixing and by the rapid removal of the solution from cell monolayers. For U-937 cells, reactions are stopped by the addition of 100  $\mu$ L of 1N HCl, with mixing. Samples are then neutralized by the addition of 100  $\mu$ L of 1N NaOH and PGE<sub>2</sub> levels measured by radioimmunoassay.

Whole cell assays for COX-2 and COX-1 using CHO transfected cell lines

- 5 Chinese hamster ovary (CHO) cell lines which have been stably transfected with an eukaryotic expression vector pCDNAIII containing either the human COX-1 or COX-2 cDNA's are used for the assay. These cell lines are referred to as CHO [hCOX-1] and CHO [hCOX-2], respectively. For cyclooxygenase assays, CHO[hCOX-1]
- 10 cells from suspension cultures and CHO[hCOX-2] cells prepared by trypsinization of adherent cultures are harvested by centrifugation (300 x g, 10 min) and washed once in HBSS containing 15 mM HEPES, pH 7.4, and resuspended in HBSS, 15 mM HEPES, pH 7.4, at a cell concentration of  $1.5 \times 10^6$  cells/ml. Drugs to be tested are dissolved in DMSO to 66.7-fold the highest test drug concentration. Compounds are typically tested
- 15 at 8 concentrations in duplicate using serial 3-fold serial dilutions in DMSO of the highest drug concentration. Cells ( $0.3 \times 10^6$  cells in 200  $\mu$ l) are preincubated with 3  $\mu$ l of the test drug or DMSO vehicle for 15 min at 37°C. Working solutions of peroxide-free AA (5.5  $\mu$ M and 110  $\mu$ M AA for the CHO [hCOX-1] and CHO [COX-2] assays, respectively) are prepared by a 10-fold dilution of a concentrated AA solution in
- 20 ethanol into HBSS containing 15 mM HEPES, pH 7.4. Cells are then challenged in the presence or absence of drug with the AA/HBSS solution to yield a final concentration of 0.5  $\mu$ M AA in the CHO[hCOX-1] assay and a final concentration of 10  $\mu$ M AA in the CHO[hCOX-2] assay. The reaction is terminated by the addition of 10  $\mu$ l 1 N HCl followed by neutralization with 20  $\mu$ l of 0.5 N NaOH. The samples are centrifuged at 300 x g at 4°C for 10 min, and an aliquot of the clarified supernatant is appropriately diluted for the determination of PGE<sub>2</sub> levels
- 25 using an enzyme-linked immunoassay for PGE<sub>2</sub> (Correlate PGE<sub>2</sub> enzyme immunoassay kit, Assay Designs, Inc.). Cyclooxygenase activity in the absence of test compounds is determined as the difference in PGE<sub>2</sub> levels of cells challenged with arachidonic acid versus the PGE<sub>2</sub> levels in cells mock-challenged with ethanol vehicle. Inhibition of PGE<sub>2</sub>

synthesis by test compounds is calculated as a percentage of the activity in the presence of drug versus the activity in the positive control samples.

U 937 cells are pelleted by centrifugation at 500 x g for 5 min and washed once with phosphate-buffered saline and repelleted. Cells are resuspended in homogenization buffer consisting of 0.1 M Tris-HCl, pH 7.4, 10 mM EDTA, 2 µg/ml leupeptin, 2 µg/ml soybean trypsin inhibitor, 2 µg/ml aprotinin and 1 mM phenyl methyl sulfonyl fluoride. The cell suspension is sonicated 4 times for 10 sec and is centrifuged at 10,000 x g for 10 min at 4° C. The supernatant is centrifuged at 100,000 x g for 1 hr at 4° C. The 100,000 x g microsomal pellet is resuspended in 0.1 M Tris-HCl, pH 7.4, 10 mM EDTA to approximately 7 mg protein/ml and stored at -80° C.

Microsomal preparations are thawed immediately prior to use, subjected to a brief sonication, and then diluted to a protein concentration of 125 µg/ml in 0.1 M Tris-HCl buffer, pH 7.4 containing 10 mM EDTA, 0.5 mM phenol, 1 mM reduced glutathione and 1 µM hematin. Assays are performed in duplicate in a final volume of 250 µl. Initially, 5 µl of DMSO vehicle or drug in DMSO are added to 20 µl of 0.1 M Tris-HCl buffer, pH 7.4 containing 10 mM EDTA in wells of a 96-deepwell polypropylene titre plate. 200 µl of the microsomal preparation are then added and pre-incubated for 15 min at room temperature before addition of 25 µl of 1 M arachidonic acid in 0.1 M Tris-HCl and 10 mM EDTA, pH 7.4. Samples are incubated for 40 min at room temperature and the reaction is stopped by the addition of 25 µl of 1 N HCl. Samples are neutralized with 25 µl of 1 N NaOH prior to quantitation of PGE<sub>2</sub> content by radioimmunoassay (Dupont-NEN or Amersham assay kits). Cyclooxygenase activity is defined as the difference between PGE<sub>2</sub> levels in samples incubated in the presence of arachidonic acid and ethanol vehicle.

### Assay of the activity of purified human COX-2

The enzyme activity is measured using a chromogenic assay based on the oxidation of N,N,N',N'-tetramethyl-p-phenylenediamine (TMPD) during the reduction of PGG<sub>2</sub> to PGH<sub>2</sub> by COX-2 (Copeland et al. (1994) Proc. Natl. Acad. Sci. 91, 11202-11206).

Recombinant human COX-2 is purified from Sf9 cells as previously described (Percival et al (1994) Arch. Biochem. Biophys. 15, 111-118). The assay mixture (180 µL) contains 100 mM sodium phosphate, pH 6.5, 2 mM genapol X-100, 1 µM hematin, 1 mg/ml gelatin, 80-100 units of purified enzyme (One unit of enzyme is defined as the amount of enzyme required to produce an O.D. change of 0.001/min at 610 nm) and 4 µL of the test compound in DMSO. The mixture is pre-incubated at room temperature (22°C) for 15 minutes prior to initiation of the enzymatic reaction by the addition of 20 µL of a sonicated solution of 1 mM arachidonic acid (AA) and 1 mM TMPD in assay buffer (without enzyme or hematin). The enzymatic activity is measured by estimation of the initial velocity of TMPD oxidation over the first 36 sec of the reaction. A non-specific rate of oxidation is observed in the absence of enzyme (0.007 - 0.010 O.D. /min) and is subtracted before the calculation of the % inhibition. IC<sub>50</sub> values are derived from 4-parameter least squares non-linear regression analysis of the log-dose vs % inhibition plot.

### HUMAN WHOLE BLOOD ASSAY

#### Rationale

Human whole blood provides a protein and cell-rich milieu appropriate for the study of biochemical efficacy of anti-inflammatory compounds such as selective COX-2 inhibitors. Studies have shown that normal human blood does not contain the COX-2 enzyme. This is consistent with the observation that COX-2 inhibitors have no effect on PGE<sub>2</sub> production in normal blood. These inhibitors are active only after

- 57 -

incubation of human whole blood with LPS, which induces COX-2. This assay can be used to evaluate the inhibitory effect of selective COX-2 inhibitors on PGE<sub>2</sub> production. As well, platelets in whole blood contain a large amount of the COX-1 enzyme. Immediately following blood clotting, platelets are activated through a thrombin-mediated mechanism. This reaction results in the production of thromboxane B<sub>2</sub> (TxB<sub>2</sub>) via activation of COX-1. Thus, the effect of test compounds on TxB<sub>2</sub> levels following blood clotting can be examined and used as an index for COX-1 activity. Therefore, the degree of selectivity by the test compound can be determined by measuring the levels of PGE<sub>2</sub> after LPS induction (COX-2) and TxB<sub>2</sub> following blood clotting (COX-1) in the same assay.

#### Method

##### A. COX-2 (LPS-induced PGE<sub>2</sub> production)

Fresh blood is collected in heparinized tubes by venipuncture from both male and female volunteers. The subjects have no apparent inflammatory conditions and have not taken any NSAIDs for at least 7 days prior to blood collection. Plasma is immediately obtained from a 2mL blood aliquot to use as blank (basal levels of PGE<sub>2</sub>). The remaining blood is incubated with LPS (100 µg/ml final concentration, Sigma Chem, #L-2630 from *E. coli*; diluted in 0.1% BSA (Phosphate buffered saline) for 5 minutes at room temperature. Five hundred µL aliquots of blood are incubated with either 2µL of vehicle (DMSO) or 2µL of a test compound at final concentrations varying from 10nM to 30µM for 24 hours at 37°C. At the end of the incubation, the blood is centrifuged at 12,000 x g for 5 minutes to obtain plasma. A 100µL aliquot of plasma is mixed with 400µL of methanol for protein precipitation. The supernatant is obtained and is assayed for PGE<sub>2</sub> using a radioimmunoassay kit (Amersham, RPA#530) after conversion of PGE<sub>2</sub> to its methyl oximate derivative according to the manufacturer's procedure.

- 58 -

**B. COX-1 (Clotting-induced TxB<sub>2</sub> production)**

Fresh blood is collected into vacutainers containing no anticoagulants. Aliquots of 500µL are immediately transferred to siliconized microcentrifuge tubes preloaded with 2µL of either DMSO or a test compound at final concentrations varying from 10nM to 30µM. The tubes are vortexed and incubated at 37°C for 1 hour to allow blood to clot. At the end of incubation, serum is obtained by centrifugation (12,000 x g for 5 min.). A 100µL aliquot of serum is mixed with 400µL of methanol for protein precipitation. The supernatant is obtained and is assayed for TxB<sub>2</sub> using a enzyme immunoassay kit (Cayman, #519031) according to the manufacturer's instruction.

**RAT PAW EDEMA ASSAY****Protocol**

Male Sprague-Dawley rats (150-200 g) are fasted overnight and are given, po, either vehicle (1% methocel or 5% Tween 80) or a test compound. One hr later, a line is drawn using a permanent marker at the level above the ankle in one hind paw to define the area of the paw to be monitored. The paw volume (V<sub>0</sub>) is measured using a plethysmometer (Ugo-Basile, Italy) based on the principle of water displacement. The animals are then injected subplantarly with 50 µl of 1% carrageenan solution in saline (FMC Corp, Maine) into the paw using an insulin syringe with a 25-gauge needle (i.e. 500 µg carrageenan per paw). Three hr later, the paw volume (V<sub>3</sub>) is measured and the increases in paw volume (V<sub>3</sub> - V<sub>0</sub>) are calculated. The animals are sacrificed by CO<sub>2</sub> asphyxiation and the absence or presence of stomach lesions scored. Data is compared with the vehicle-control values and percent inhibition calculated. All treatment groups are coded to eliminate observer bias.

**NSAID-INDUCED GASTROPATHY IN RATS****Rationale**

- 59 -

The major side effect of conventional NSAIDs is their ability to produce gastric lesions in man. This action is believed to be caused by inhibition of Cox-1 in the gastrointestinal tract. Rats are particularly sensitive to the actions of NSAIDs. In fact, rat models have been used commonly in the past to evaluate the gastrointestinal side effects of current conventional NSAIDs. In the present assay, NSAID-induced gastrointestinal damage is observed by measuring fecal  $^{51}\text{Cr}$  excretion after systemic injection of  $^{51}\text{Cr}$ -labeled red blood cells. Fecal  $^{51}\text{Cr}$  excretion is a well-established and sensitive technique to detect gastrointestinal integrity in animals and man.

### Methods

Male Sprague Dawley rats (150 - 200 g) are administered orally a test compound either once (acute dosing) or b.i.d. for 5 days (chronic dosing). Immediately after the administration of the last dose, the rats are injected via a tail vein with 0.5 mL of  $^{51}\text{Cr}$ -labeled red blood cells from a donor rat. The animals are placed individually in metabolism cages with food and water *ad lib*. Feces are collected for a 48 h period and  $^{51}\text{Cr}$  fecal excretion is calculated as a percent of total injected dose.  $^{51}\text{Cr}$ -labeled red blood cells are prepared using the following procedures. Ten mL of blood is collected in heparinized tubes via the vena cava from a donor rat. Plasma is removed by centrifugation and replenished with equal volume of HBSS. The red blood cells are incubated with 400 Ci of sodium  $^{51}\text{Cr}$  chromate for 30 min. at 37C. At the end of the incubation, the red blood cells are washed twice with 20 mL HBSS to remove free sodium  $^{51}\text{Cr}$  chromate. The red blood cells are finally reconstituted in 10 mL HBSS and 0.5 mL of the solution (about 20 Ci) is injected per rat.

## PROTEIN-LOSING GASTROPATHY IN SQUIRREL MONKEYS

### Rationale

- Protein-losing gastropathy (manifested as appearance of circulating cells and plasma proteins in the GI tract) is a significant and dose-limiting adverse response to standard non-steroidal anti-inflammatory drugs (NSAIDs). This can be quantitatively assessed by intravenous administration of  $^{51}\text{CrCl}_3$  solution. This isotopic ion can avidly bind to cell and serum globins and cell endoplasmic reticulum.
- Measurement of radioactivity appearing in feces collected for 24 h after administration of the isotope thus provides a sensitive and quantitative index of protein-losing gastropathy.

### Methods

- Groups of male squirrel monkeys (0.8 to 1.4 kg) are treated by gavage with either 1% methocell or 5% Tween 80 in H<sub>2</sub>O vehicles, (3mL/kg b.i.d.) or test compounds at doses from 1 - 100 mg/kg b.i.d. for 5 days. Intravenous  $^{51}\text{Cr}$  (5Ci/kg in 1 ml/kg phosphate buffer saline (PBS)) is administered 1 h after the last drug/vehicle dose, and feces collected for 24 h in a metabolism cage and assessed for excreted  $^{51}\text{Cr}$  by gamma-counting. Venous blood is sampled 1 h and 8 h after the last drug dose, and plasma concentrations of drug measured by RP-HPLC.

## RAT PLASMA LEVELS

25

### Per Os Pharmacokinetics in Rats

#### PROCEDURE:

- The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.
- Male Sprague Dawley rats (325-375 g) are fasted overnight prior to each PO blood level study.
- The rats are placed in the restrainer one at a time and the box is firmly secured. The zero blood sample is obtained by nicking a

- 61 -

small (1 mm or less) piece off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top to the bottom to milk out the blood. Approximately 1 mL of blood is collected into a heparinized vacutainer tube.

5

Compounds are prepared as required, in a standard dosing volume of 10mL/kg, and administered orally by passing a 16 gauge, 3" gavaging needle into the stomach.

10

Subsequent bleeds are taken in the same manner as the zero bleed except that there is no need to nick the tail again. The tail is cleaned with a piece of gauze and milked/stroked as described above into the appropriately labelled tubes.

15

Immediately after sampling, blood is centrifuged, separated, put into clearly marked vials and stored in a freezer until analysed.

Typical time points for determination of rat blood levels after PO dosing are:

20

0, 15min, 30min, 1h, 2h, 4h, 6h

After the 4hr time point bleed, food is provided to the rats *ad libitum*. Water is provided at all times during the study.

25

#### Vehicles:

The following vehicles may be used in PO rat blood level determinations:

30 PEG 200/300/400 - restricted to 2 mL/kg  
Methocel 0.5% - 1.0% 10mL/kg  
Tween 80 5% 10mL/kg

35 Compounds for PO blood levels can be in suspension form. For better dissolution, the solution can be placed in a sonicator for approximately 5 minutes.

#### Intravenous Pharmacokinetics in Rats

40 **PROCEDURE:**

- 62 -

The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.

5 Male Sprague Dawley (325-375 g) rats are placed in plastic shoe box cages with a suspended floor, cage top, water bottle and food.

The compound is prepared as required, in a standard dosing volume of 1mL/kg.

10 Rats are bled for the zero blood sample and dosed under CO<sub>2</sub> sedation. The rats, one at a time, are placed in a primed CO<sub>2</sub> chamber and taken out as soon as they had lost their righting reflex. The rat is then placed on a restraining board, a nose cone with CO<sub>2</sub> delivery is placed over the muzzle and the rat restrained to the board  
15 with elastics. With the use of forceps and scissors, the jugular vein is exposed and the zero sample taken, followed by a measured dose of compound which is injected into the jugular vein. Light digital pressure is applied to the injection site, and the nose cone was removed. The time is noted. This constituted the zero time point.

20 The 5 min bleed is taken by nicking a piece (1-2 mm) off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top of the tail to the bottom to milk the blood out of the tail. Approximately 1 mL of blood is collected into a heparinized  
25 collection vial. Subsequent bleeds are taken in the same fashion, except that there is no need to nick to tail again. The tail is cleaned with a piece of gauze and bled, as described above, into the appropriate labelled tubes.

30 Typical time points for determination of rat blood levels after I.V. dosing are either:

0, 5 min, 15min, 30min, 1h, 2h, 6h  
or 0, 5 min, 30min, 1h, 2h, 4h, 6h.

35 Vehicles:

The following vehicles may be used in IV rat blood level determinations:

40 Dextrose: 1mL/kg  
Moleculsol 25%: 1mL/kg

- 63 -

DMSO: (Dimethylsulfoxide) Restricted to a dose volume of 0.1 mL per animal

PEG 200: Not more than 60% mixed with 40% sterile water - 1mL/kg

- 5 With Dextrose, either sodium bicarbonate or sodium carbonate can be added if the solution is cloudy.

- 10 For analysis, aliquots are diluted with an equal volume of acetonitrile and centrifuged to remove protein precipitate. The supernatant is injected directly onto a C-18 HPLC column with UV detection. Quantitation is done relative to a clean blood sample spiked with a known quantity of drug. Bioavailability (F) is assessed by comparing area under the curve (AUC) i.v. versus p.o.

15 
$$F = \frac{AUC_{po}}{AUC_{iv}} \times \frac{DOSE_{iv}}{DOSE_{po}} \times 100\%$$

Clearance rates are calculated from the following relation:

20 
$$Cl = \frac{DOSE_{iv}(mg/kg)}{AUC_{iv}}$$

The units of Cl are mL/h•kg (milliliters per hour kilogram)

#### Representative Biological Data

- 30 Compounds of the present invention are prodrugs of inhibitors of COX-2 and are thereby useful in the treatment of COX-2 mediated diseases as enumerated above. The extent of conversion of these compounds to the active COX-2 inhibitors may be seen in the representative results shown below along with their antiinflammatory activity. The plasma levels indicated are the maximum rat plasma concentrations of the active COX-2 inhibitor observed when the rat was
- 35 treated with a 20 mg/kg oral dose of the indicated prodrug. The ED<sub>50</sub> values in the rat paw edema assay represent the dose of prodrug required to reduce edema formation by 50% as compared to the vehicle control.

The following section provides example for the preparation of starting materials for the preparation of compounds within the scope of the invention. As appreciated by those of skill in the art, the following section is a self-contained unit. Thus, while the section may contain Example numbers and other designations which duplicate those used for the compounds of the instant invention, such duplication is not to be regarded as an assertion that the Examples and designations are identical.

Starting materials for the preparation of compounds of the present invention can be prepared according to the following methods

#### Method A

An appropriately substituted acid halide is reacted with thioanisole in a solvent such as chloroform in the presence of a Lewis acid such as aluminum chloride to afford a ketone which is then hydroxylated with base such as aqueous sodium hydroxide in a solvent such as carbon tetrachloride with a phase transfer agent such as Aliquat 336. Then treatment with an oxidizing agent such as MMPP in solvents such as  $\text{CH}_2\text{Cl}_2/\text{MeOH}$ , affords an sulfone which is reacted with an appropriately substituted acetic acid in a solvent such as  $\text{CH}_2\text{Cl}_2$  in the presence of an esterifying agent such as CMC and DMAP and then

- 79 -

treated with DBU to afford lactone Ia.

- 80 -

**Method B**

- 5 An appropriately substituted hydroxyketone is acylated with an appropriately substituted acid halide in a solvent such as dichloromethane in the presence of a base such as pyridine. The ester obtained is then reacted with an appropriately substituted nucleophile  $R^2XH$  in a solvent such as DMF and with a base such as sodium hydride, then treatment with DBU in a solvent such as acetonitrile affords lactone **1a**.

- 81 -

Method C

- 5 A halo ester of acetic acid is coupled with an appropriately substituted nucleophile in water with sodium hydroxide to give an appropriately substituted acetic acid which is then reacted as in method A to afford lactone Ia.

Ia

$\text{R}^1 = \text{SO}_2\text{Me}$   
 $\text{X} = \text{O}, \text{S}, \text{NR}^{15}$

- 82 -

**Method D**

- 5 A halo ester is reacted with an appropriately substituted amine  $R^2R^{15}NH$  in a solvent such as toluene to give an intermediate which is then reacted with DBU in a solvent such as acetonitrile to afford lactone **1a**.

- 83 -

**Method E**

- 5 An appropriately substituted bromoketone is reacted with an appropriately substituted acid in a solvent such as ethanol or acetonitrile in the presence of a base such as diisopropylethylamine or triethylamine to afford an ester which is then treated with DBU in a solvent such as acetonitrile to afford lactone Ia.

- 84 -

**Method F**

- 5 An appropriately substituted hydroxyketone is reacted with an appropriately substituted acid halide in a solvent such as dichloromethane and with a base such as pyridine to afford an ester which is then cyclized using sodium hydride in a mixture of THF and DMF to afford a lactone. The lactone is then oxidized with an oxidizing agent such as MMPP, mCPBA or OXONE® in solvents such as
- 10 dichloromethane and/or methanol to afford lactone Ia.

- 85 -

**Method G**

- An appropriately substituted hydroxyketone is acylated with acetyl bromide or chloride in a solvent such as dichloromethane with a base such as DBU and DMAP. Further treatment with a base such as sodium hydride in a solvent such as DMF effects cyclization to afford the 5-membered lactone. Treatment of this lactone with a base such as LDA and an appropriately substituted acid halide in a solvent such as THF, followed by oxidation with a reagent such as MMPP in solvent such as CH<sub>2</sub>Cl<sub>2</sub>/MeOH and hydrolysis by a base such as NaOH in a solvent such as MeOH/THF gives an alcohol **Ib** which is then oxidized to lactone **Ic** by a reagent such as Jones' reagent in a solvent such as acetone (the initially formed ketone is reduced in the reaction and acylated, thus requiring hydrolysis and re-oxidation to obtain ketone **Ic**). Alternatively, alcohol **Ib** can be obtained by using an aldehyde R<sup>2</sup>CHO as the electrophile instead of an acid halide.

- 86 -

**Method H**

- 5 An appropriately substituted methyl sulfide is oxidized to the sulfoxide with a reagent such as MMPP in solvents such as dichloromethane and methanol followed by treatment with trifluoroacetic anhydride, then aqueous sodium hydroxide. Further treatment by Cl<sub>2</sub> in aqueous acetic acid followed by treatment by an amine affords an intermediate sulfonamide. This sulfonamide is then esterified with an
- 10 appropriately substituted acid in the presence of a reagent such as CMC and further treatment with a base such as DBU affords the lactone. In the case where the amine group is protected by an acid labile group treatment with an acid such as trifluoroacetic acid in a solvent such as dichloromethane affords compound Ia.

**Method I**

- 5 An appropriately substituted bromoketone is reacted with an appropriately substituted acid in a solvent such as acetonitrile and with a base such as Et<sub>3</sub>N. Treatment with DBU and then O<sub>2</sub> gives a hydroxy compound **Id**. Etherification of this hydroxy with an alcohol in a solvent such as THF and with an acid such as HCl gives **Ie**. By oxidation of the sulfide into a sulfone by a reagent such as m-CPBA and then displacement of this sulfone by an appropriately substituted nucleophile compound **If** is obtained.
- 10

- 88 -

**Method I**

- 5 An appropriately substituted nucleophile is reacted with an appropriately substituted haloacetate in a solvent such as acetonitrile with a base such as DBU to afford compound Ia.

- 89 -

**Method K**

- 5 An appropriately substituted vinyl ketone is coupled with an appropriately substituted benzaldehyde with a catalyst such as 3-benzyl-5-(2-hydroxyethyl)-4-methylthiazolium chloride in the presence of a base such as triethylamine in a solvent such as 1,4-dioxane to form a diketone. The diketone is cyclized in a solvent such as methanol with a base such as DBU to the final product Ig. When  $R^1 = \text{SO}_2\text{Me}$ , the starting material can
- 10 also be a p-methylthiobenzaldehyde, with the methylthio group being oxidized to  $\text{SO}_2\text{Me}$  using MMPP, mCPBA or OXONE® in the last step.

15

Step 1       5,5-Dimethyl-3-hydroxy-4-(4-methylsulfonylphenyl)-5H-furan-2-one

20           To a 0°C solution of the alcohol of Example 1, Step 3 (29.5 g, 122 mmol) in CH<sub>3</sub>CN (350 mL) were added pyridine (25 mL) and acetoxyacetyl chloride (25 g, 183 mmol). After a period of 7h at r.t., DBU (31 mL) was added to the reaction mixture. After a period of 1h at 80°C, a second portion of DBU (35 mL) was added. The reaction mixture was kept at 80°C for 18h. The reaction mixture was allowed to cool to r.t. The mixture was poured onto ice-water (2.5L) containing 100 mL of concentrated HCl. The brown solid was collected and dissolved in hot acetonitrile and was filtered through a plug of silica. The solvent was evaporated and the resultant solid was swished in EtOAc to give the title compound (21.2g, 62%).

**EXAMPLE 109b****5,5-Dimethyl-4-(4-methylsulfonylphenyl)-3-(2-propoxy)-5H-furan-2-one**

**Step 1:** 5,5-Dimethyl-3-hydroxy-4-(4-methylsulfonylphenyl)-5H-  
15 furan-2-one

To a 0°C solution of the alcohol of Example 1, Step 3 (14.0 g, 57.8 mmol) in CH<sub>3</sub>CN (180 mL) were added pyridine (10.0 mL) and acetoxyacetyl chloride (12.7 g, 93.0 mmol) after a period of 7h at r.t., DBU (15.0 mL) was added to the reaction mixture. After a period of 1h  
20 at 80°C, a second portion of DBU (20.0 mL) was added. The reaction mixture was kept at 80°C for 18h. The reaction mixture allowed to cool to r.t. The mixture was diluted with EtOAc (500 mL) and H<sub>2</sub>O (500 mL) and acidified with 6NHCl. After the addition of brine (100 mL), the aqueous phase was extracted 2 times with EtOAc. The organic phase was

**Step 2** 5,5-Dimethyl-4-(4-methylsulfonylphenyl)-3-(2-propoxy)-

To a suspension of the alcohol of Step 1 (100 mg, 0.354 mmol) in benzene (5.0 mL) were added an excess of 2-iodopropane (105 mL) and Ag<sub>2</sub>CO<sub>3</sub> (294 mg, 1.06 mmol). After a period of 18h at 45°C, the reaction mixture was filtered over celite and washed with

<sup>1</sup>H NMR (CD<sub>3</sub>COCD<sub>3</sub>) δ 1.25 (6H, d), 1.70 (6H, s), 3.20 (3H, s), 5.20 (1H, Septet), 8.05 (4H, s).

5                   Alternatively compound 109 may be prepared in the following manner:

**Step A 1: 2-Methyl-1-(4-(thiomethyl)phenyl)propan-1-one**

10                   A 500 mL flask was charged under N<sub>2</sub> with 34.5g ( 259 mMol) of AlCl<sub>3</sub> and 100 mL of ODCB. The vigorously stirred slurry was cooled to 8°C and isobutyryl chloride (28.6 mL, 261 mMol) was added over 30 min., keeping the temperature at 10-15°C.

15                   The addition of isobutyryl chloride was slightly exothermic. The AlCl<sub>3</sub>/isobutyryl chloride complex was aged at 7°C for 30 min. Efficient cooling was applied and thioanisole (31.2g) was added to the reaction mixture over 120 min., maintaining an internal temperature of 8-13°C.

20                   The addition of thioanisole was very exothermic. After the addition of about half of thioanisole a heavy yellow precipitate formed. The precipitation was accompanied by an exotherm. Gaseous HCl is formed in the reaction, so that the effluent gas stream should be scrubbed with aqueous NaOH before release into the atmosphere.

25                   The reaction was warmed to 16°C over 1h.

                    The reaction mixture was a thick yellow slurry at this point. HPLC analysis of a quenched (EtOAc/H<sub>2</sub>O) aliquot indicated completion of reaction.

30                   The reaction mixture was cooled to 10°C and 160 mL of 5% aqueous HCl were added over 45 min.

                    The addition was extremely exothermic and especially the initial addition required careful temperature monitoring.

- 121 -

The biphasic mixture was vigorously stirred for 60 min. The lower organic phase was removed.

A quantitative assay of the organic phase indicated a 98% yield.

5

Step A 2: 2-Bromo-2-methyl-1-(4-(thiomethyl)phenyl)propan-1-one

10 A 500 mL flask was charged with the solution of the compound from step A 1 (246 mMol) . Approximately 10% of the bromine (1.3 mL, 26 mMol) were added and the reaction mixture was stirred until the red color had dissipated after 45 min. The remainder of the Br<sub>2</sub> (12 mL) was added over 60 min.

15

The reaction was exothermic and the temperature rose to ca. 32°C.

Gaseous HBr was released from the reaction, thus the effluent gas stream was scrubbed with aqueous NaOH before release into the atmosphere.

20

The reaction mixture was aged for 2 h at 30°C when HPLC analysis indicated completion of the reaction

Addition of a slight excess of Br<sub>2</sub> leads to the partial oxidation of the sulfide to the sulfoxide .

25 The reaction was quenched by the addition of 160 mL H<sub>2</sub>O and the resulting 182.0 mL of organic phase were used directly for the oxidation (next step) (95% assay yield).

Step A 3: 2-Bromo-2-methyl-1-(4-(methylsulfonyl)phenyl)propan-1-one

30

To a solution of the compound from the previous step in ODCB in a 500 mL reaction vessel with heating jacket, reflux condenser and bottom valve was added under N<sub>2</sub> a solution of Na<sub>2</sub>WO<sub>4</sub> (0.45g, 1.4mMol) and Aliquat 336 (2.2g, 5.4 mMol) in 3.0 mL H<sub>2</sub>O. The

- 122 -

heterogeneous reaction mixture was heated with vigorous stirring to 35°C and ca. 3.0 mL of H<sub>2</sub>O<sub>2</sub> (30%) were added.

The oxidation was extremely exothermic. After an induction period of ca. 3 min. the temperature rose quickly to 50-65°C.

5       The remainder of the H<sub>2</sub>O<sub>2</sub> (36 mL) was added over 1 h. At the end of the addition HPLC analysis indicated completion of the reaction.

The reaction mixture was heated to 80°C, the lower organic phase was removed and cooled to 6°C over 1 h.

10       The product precipitated at ca. 50°C without seeding.

The slurry was filtered and washed with 25.0 mL of ODCB and 30.0 mL of hexane and three times with 20.0 mL of 60°C H<sub>2</sub>O. After drying 37.8 g of the title compound (97% yield, ca. 91% overall yield from thioanisole) were obtained as a white powder.

15       Step A 4: Isopropoxyacetic acid

20       A 500 mL vessel fitted with a mechanical stirrer, thermocouple probe, and nitrogen inlet is charged with 200 mL of IPA (K.F. 220 µg/mL) and sodium hydroxide (6.0 g, 0.145 mol). The mixture was heated at reflux until the solid sodium hydroxide dissolved.

A homogeneous solution is obtained after reflux for 3 h.

25       The solution was cooled at ~ 70 °C and toluene (15.0 mL) was added. It was distilled until ~100 mL of distillate was collected. A mixture of IPA/toluene (85:15, 100 mL) was added and ~ 0.1L of liquid was distilled off (repeated 3 x). At the end of distillation (~0.4 L of distillate collected), the solution was diluted with IPA to a volume of ~  
30   300 mL.

35       The distillate is assayed to determine the amount of water removed. If the water removed is < 75% of the theoretical amount (K.F. of IPA + that in NaOH + 1 equiv generated), the distillation should be continued. The solution was then cooled at 60-70 °C and sodium

- 123 -

chloroacetate (15.9 g, 0.134 mol) was added in portions over 5 min. No exotherm is observed during the addition.

5 The mixture was heated at reflux for 3 h and a sample of the slurry was taken for assay.

The reaction is followed by  $^1\text{H}$ NMR. An aliquot (~0.2 mL) of the mixture is taken and evaporated to dryness. The residue is dissolved in  $\text{D}_2\text{O}$  for  $^1\text{H}$ NMR measurement. The reaction is considered completed when the starting material is < 3 % vs. product.

10 The reaction was quenched by addition of 60.0 mL of water and concentrated under reduced pressure (150-200 mBar, 50-60 °C) until ~250 mL of distillate was collected. More water was added (40.0 mL) and the solution was distilled at normal pressure until the batch temperature reached ~103 °C (~ 100mL of solution left, ~300 mL of  
15 solvent removed). The solution was cooled at 10-20 °C and neutralized by addition of conc. hydrochloric acid (12.5 mL, 0.15 mol).

External cooling may be needed during the addition of acid. The final pH should be < 2.3, preferably ~2.

20 t-Butyl methyl ether (80.0 mL) was added. The aqueous solution was saturated with sodium chloride (~ 9.0 g) and the two-phase mixture was agitated for 0.5 h at 10-15 °C. The layers were separated and the aqueous layer was back extracted with 2 x 60.0 mL of t-butyl methyl ether. The  
25 organic layers were combined and washed with 2 x 10.0 mL of saturated aqueous sodium chloride.

The pH of the 2nd brine wash should be > 2.5.

30 The organic solution was dried over 4A molecular sieves (10.0 g) for 14 h and filtered. The sieves were washed with 3 x 15.0 mL of t-butyl methyl ether. t-Butyl methyl ether was removed under reduced pressure (~200 mBar, 45-50 °C). Isopropoxyacetic acid was obtained as a slightly yellow liquid.

- 124 -

Yield: 11.8 g, 75 % yield.

5     **Step A 5:    2-(isopropoxy)acetic acid 2-methyl-1-(4-methylsulfonyl)phenyl)propan-1-one-2-yl ester**

          A 100 mL flask was sequentially charged with dry ethanol (45.0 mL, K.F. < 100 µg/mL), isopropoxyacetic acid (2.32 g), diisopropylethylamine (4.85 mL) and the bromosulfone ( step A 3)(5.0 g). The mixture is heated to reflux until the bromosulfone is not detected (HPLC, reaction time 12-14 hours).

          The reaction is considered complete when the bromosulfone is < 0.05 A% vs. product.

15           After the reaction was complete, the solution was allowed to cool and seeded at 42°C. Crystallization initiated immediately and the mixture was cooled to 1° C and aged 1 hr. The product ester is filtered and washed with ethanol (0°C 5.0 mL wash). After drying in a vacuum oven, the white crystalline title compound was used as is in the next step.

20     Yield: 4.15 g.

**Step A 6:    5,5-Dimethyl-4-(4-methylsulfonylphenyl)-3-(2-propoxy)-5H-furan-2-one**

25           A 1L flask was sequentially charged with dry acetonitrile (320 mL, K.F. < 100 µg/mL), isopropyl trifluoroacetate (30.1 g, 0.193 mol), and DBU (36.70 g, 0.24 mol). The solution was stirred at ~20 °C for 15 min and the ester from Step A5 (55.0 g, 0.161 mol) was added. The solution was heated at reflux under nitrogen and the progress of the reaction was followed by HPLC.

30           The reaction is considered complete when the intermediate peaks are < 0.2 A% vs. product.

          After the reaction was complete, the solution was cooled at ~40 °C and filtered (1 µ in-line capsule). The solution was then concentrated at 40-50 °C under reduced pressure until ~0.20 L of

35

- 125 -

distillate was collected. Water (350 mL) was added slowly at  $-45^{\circ}\text{C}$ . After  $\sim 130$  mL of water was added, the solution turned cloudy ( $40-45^{\circ}\text{C}$ ) and  $\sim 0.02$  g of crystalline title compound was added as the seed. The mixture was aged for 30 min and the remaining water was added. The mixture was aged at  $-20^{\circ}\text{C}$  for 6 h then filtered. The cake was washed with 2 x 65 mL of 1:4 MeCN/water and 3 x 65 mL of water. The title product was air dried and dried *in vacuo* ( $35^{\circ}\text{C}$ , 200 mBar).

Yield:  $\sim 48.0$  g, 92%.

To a 0°C solution of 2-cyclopenten-1-one (125 g, 1.52 mol) in CCl<sub>4</sub> (1.2 L) in a three-neck flask equipped with an overhead stirrer was added a solution of bromine (269 g, 1.68 mol) in CCl<sub>4</sub> (400 mL) dropwise over 4 h, maintaining an internal temperature <2°C. A solution of Et<sub>3</sub>N (310 mL, 2.22 mol) in CCl<sub>4</sub> (200 mL) was then added dropwise over 1.5 h, maintaining an internal temperature <10°C. The resulting suspension was warmed to r.t. for 1 h, then cooled to 0°C and filtered. The filtrate was washed with two 700 mL portions of 3M HCl and 500 mL of brine, then filtered through cotton. Concentration provided 228 g of an orange oil which was crystallized from 150 mL of 2:1 hexane: ether to provide 191 g of the title compound.

<sup>1</sup>H NMR (CD<sub>3</sub>COCD<sub>3</sub>) δ 7.94 (1H, t), 2.72 (2H, m), 2.46 (2H, m).

**20 Step 2: 2-Bromo-3-(4-(methylthio)phenyl)-2-cyclopenten-1-one**

To a -78°C solution of 4-bromothioanisole (35.1 g, 173 mmol) in THF (500 mL) was added nBuLi (1.6 M in hexanes, 107.5 mL, 172 mmol). The solution was stirred for 45 min, then a solution of 2-bromo-2-cyclopenten-1-one (25.4 g, 158 mmol) in THF (150 mL) was added and the mixture was allowed to warm to 0°C and was quenched with saturated aqueous NH<sub>4</sub>Cl. The majority of the solvent was removed *in vacuo* and the residue was suspended in water and extracted with two portions of EtOAc. The organic layers were washed with brine, dried over MgSO<sub>4</sub>, filtered and concentrated. This material was dissolved in DMF (300 mL), cooled to 0°C and treated with PDC (72.4 g, 192 mmol). The resulting mixture was warmed to r.t. and stirred for 2 h, then poured into H<sub>2</sub>O (1.2 L) and extracted with two 500 mL portions of EtOAc. The organic layers were washed with brine, dried over MgSO<sub>4</sub>, filtered and

- 172 -

concentrated to give the title compound as a light brown solid which was used directly in the next step.

Step 3: 2-Bromo-3-(4-(methylsulfonyl)phenyl)-2-cyclopenten-1-one

5 To a 0°C solution of 2-bromo-3-(4-(thiomethyl)phenyl)-2-cyclopenten-1-one in 2:1 CH<sub>2</sub>Cl<sub>2</sub>/MeOH (500 mL) was added MMPP (100 g). The mixture was stirred at r.t. overnight, then concentrated and partitioned between saturated NaHCO<sub>3</sub>, 1M Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and CH<sub>2</sub>Cl<sub>2</sub>. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>, and the combined organics  
10 were washed with brine, filtered through cotton and evaporated. The resulting solid was swished in CH<sub>2</sub>Cl<sub>2</sub>/Et<sub>2</sub>O to provide 23 g of the title compound.

15 <sup>1</sup>H NMR (CD<sub>3</sub>COCD<sub>3</sub>) δ 8.12 (4H, m), 3.22 (2H, m), 3.20 (3H, s), 2.69 (2H, m).

Step 4: Lithium 3-pyridinyltrimethyl boronate

To a -88°C solution of 3-bromopyridine (10.1 mL, 104.8 mmol) in Et<sub>2</sub>O (450 mL) was added a 1.6 M hexane solution of n-BuLi  
20 (66 mL, 105.6 mmol). The reaction mixture was warmed to -78°C for 1 h to give a thick yellow slurry. Triisopropyl borate (26 mL, 112.7 mmol) was then added to give a slight exotherm (-78°C to -63°C) and a clear solution. The mixture was stirred at -78°C for 15 min, then warmed to r.t.  
25 and concentrated to dryness. The residue was dissolved in MeOH and concentrated three times to give 27.2 g of pyridin-3-yl-trimethyl lithium boronate. This material was used in the next step without further purification.

30 <sup>1</sup>H NMR (CD<sub>3</sub>OD, 400 MHz) δ 7.15 (1H, m), 7.85 (1H, m), 8.15 (1H, m), 8.50 (1H, m)

Step 5: 3-(4-(Methylsulfonyl)phenyl)-2-(3-pyridinyl)-2-cyclopenten-1-one

- 173 -

- To a mixture of 2-bromo-3-(4-(methylsulfonyl)phenyl)-2-cyclopenten-1-one (3.37 g, 10.7 mmol), lithium 3-pyridinyltrimethyl boronate (3.43 g, 18.2 mmol), Pd<sub>2</sub>(dba)<sub>3</sub> (0.196 g, 0.214 mmol), and PPh<sub>3</sub> (0.224 g, 0.855 mmol) was added toluene (75 mL), n-propanol (25 mL), and H<sub>2</sub>O (25 mL). The mixture was degassed and stirred under N<sub>2</sub> for 15 min then heated to reflux. After 4 h, the reaction mixture was cooled to r.t., diluted with 100 mL of CH<sub>2</sub>Cl<sub>2</sub> and washed with H<sub>2</sub>O. The aqueous layer was separated and washed 3 times with 100 mL of CH<sub>2</sub>Cl<sub>2</sub>. The organic layers were combined, washed with brine and filtered through cotton. The filtrate was concentrated to dryness and the residue was purified by flash chromatography (100 % EtOAc) followed by swishing in a mixture of CH<sub>2</sub>Cl<sub>2</sub> and Et<sub>2</sub>O to provide 2.6 g of the title compound.
- <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 8.55 (1H, m), 8.34 (1H, m), 7.40 (2H, m), 7.65 (1H, m), 7.49 (2H, m), 7.33 (1H, m), 3.12 (2H, m), 3.05 (3H, s), 2.80 (2H, m).

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 17 and 18 are directed to a method of treatment of (diagnostic method practised on) the human/animal body the search has been carried out and based on the alleged effects of the compound/ composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
